IT3060 – Human Computer Interaction

Lecture 03

Need Findings and User Research Techniques

User Research, User Research Methods, Interviews and Focus Groups, User Survey, Standards, Personas, Contextual Inquiry, Scenarios

Agenda

Need finding and user research techniques

- Understand the user (90mins)
- Personas & Storyboarding (15mins)
- Contextual Inquiry (30mins)
- Scenarios (15mins)

Understand the User

- People who interact directly with the product to achieve a task.
- however, there are others who can also be thought of as users.

  For example,

  - Holtzblatt and Jones (1993) include in their definition of users those who manage direct users, those who receive products from the system, those who test the system, those who make the purchasing decision, and those who use competitive products.

Understand the User

- Eason (1987) identifies three categories of user: primary, secondary, and tertiary.
- Primary users are those likely to be frequent hands-on users of the system; secondary users are occasional users or those who use the system through an intermediary;
- tertiary users are those affected by the introduction of the system or who will influence its purchase

You are NOT the User!

(Scandinavia is the average of Denmark, Finland, Norway, and Sweden. The UK is the population-

What is user research?

- User research describes the effort of understanding the big picture context of who our users are and what they need from us — so that we design digital experiences that they value.

What is user research?

user research helps us to:

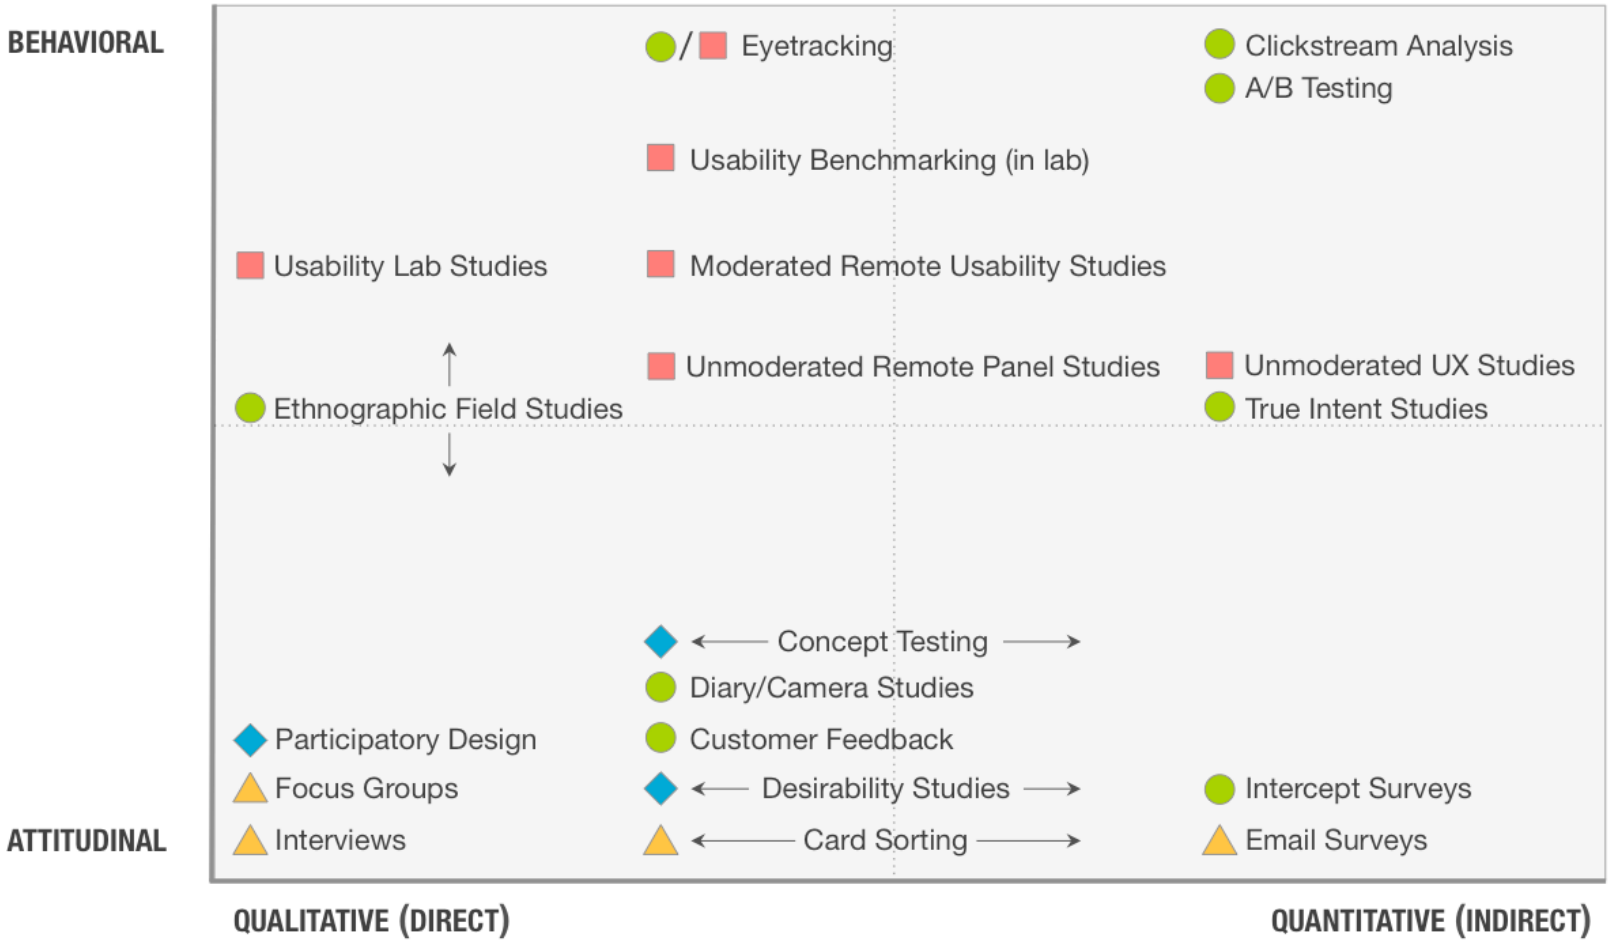

- understand who we're designing and publishing for, within which usage contexts
- getting feedback on the usability and effectiveness of our products and services
- finding out what 'better' looks like, from the perspective of those we seek to serve

User-Experience Research Methods

- To better understand when to use which method, it is helpful to view them along a 3-dimensional framework with the following axes:

1. Attitudinal vs. Behavioral
2. Qualitative vs. Quantitative
3. Context of Use

A Landscape of User Research Methods

KEY FOR CONTEXT OF PRODUCT USE DURING DATA COLLECTION

- Natural use of product
- Scripted (often lab-based) use of product
- De-contextualized / not using product
- Combination / hybrid

© 2014
Christian Rohrer

Interviews & Focus Groups

Interviews

- Many aspects of a person's experience are be difficult to infer directly from actions
- Answer "why?" questions
- Allows reflection on rare activities & events

Types of Interview

- Structured
- Unstructured
- Semi-structured

Structured Interview

Best used when,

- Relevant literature is highly developed with established understanding of topic
- Following observational/less structured interviewing approaches

- Questions generally closed
  - Eg:Is your health excellent, good, fair, or poor?
- Requires careful planning

Benefits:

- Best used to confirm facts/knowledge
- Consistent data that can be compared across number of respondents

Unstructured Interviews

- Relatively unstructured
- No specific predetermined questions.
- No strong plans for sequencing of questions
- Usually open-ended questions
  - Not just yes/no answers

  Eg: “This research study is about how people think about their own health. Can you tell me about your own experiences?
- Questions emerge over time as investigator learns about the setting

Semi-structured Interviews

- A compromise between structured and unstructured
- Generally organized around set of predetermined, open-ended questions
- Other questions emerge from dialogue between interviewer and interviewee
- Eg: “What do you think good health is?”, “how do you consider your own health”

	STRUCTURED	SEMI-STRUCTURED	UNSTRUCTURED
Questions asked	Same for all participants	Guided by participants' responses but with interview guide	Guided by participants' responses but with no interview guide
Pre-determined questions	Yes (often with limited set of responses)	Some	No (but pre-determined goal & focus for interview in place)
Open-ended questions	No	Yes	Yes
Question wording	Standardized	Flexible	Flexible
Typical Use	Well-developed understanding of topic with clear focus	-One chance to interview participants -Data collection "out in field"	-Researcher's understanding still evolving -Ideally, multiple chances to interview participants possible
Data recording	-Paper-based (mail or face-to-face) & self-report -Web-based & self-report -Telephone interviews	-Best to record interviews & analyze afterwards -Consider note-taker if recording not an option	-Best to record interviews & analyze afterwards -Consider note-taker if recording not an option
Benefits	-Efficient -No rapport required -Responses can be compared across respondents	-Participants allowed freedom to express their views -Provide reliable, comparable qualitative data	-Useful if understanding of area not yet established -Important preliminary step towards more structured interviews/surveys

How to Interview Participants?

- **1. Prepare** your questions
- **2. Schedule** and arrange meeting
- 3. Conduct the **interview**
- **4. Analyse**

Copyright 2016 Svetlana Yarosh.

1. Prepare Your Questions for the interview

- Open-ended wording
- Plan the time
- Note possible follow-up questions
- **Pilot**

Copyright 2016 Svetlana Yarosh. All rights reserved.

2. Schedule and Arrange

- Consider setting, presentation, etc.

In most interview studies, unless you have somebody to help out with this stage, the scheduling and arranging and recruiting take about one forth of the time and the whole study. So it's a fairly significant undertaking. So just make sure that you plan for that in your schedule.

- Follow up to confirm the participation
- Make sure to be safe

Copyright 2016 Svetlana Yarosh. All rights reserved.

e.g., with children…

- Choose some thing like this

- Not like this

e.g., with children…

Wear something like this

Not like this

3. Conduct Interview

- Audio record the interview
- Take loose notes, but focus on listening
- Follow up on hunches and unusual responses
- Be comfortable with silence
- Listen afterwards to critique yourself

4. Analyse

Tools for Interviews

- Best way to do interview is **in person**,
- But also can be done via:
    - Telephone
    - Video chat

- **Avoid** interview over email or chat (its hard whenever the person has to type)

Focus Groups

- Inviting many participants to answer/discuss questions at the same time(3-10)
- Careful group selection, based on role and demographics

  Heterogeneous or homogenous groups,

e.g.:

  - multiple families, same role (group of dads)
  - single family, multiple roles (mom, dad, kids)

Focus Groups : Pros and Cons

Advantages:

- Broad range of views and insights
- Disagreement and debate can be informative
- Supports interactivity, can stimulate discussion

Disadvantages:

- Needs skilled facilitator(s)
- Discussions take time, so limited coverage of issues
- Some participants can monopolize discussions

Difference between interviewing Individuals vs. Focus Groups

Individual

- more **time**/effort spent with each participant
- easier to coordinate the **logistics**
- more **privacy** for the participants

Focus Groups

- easier to solicit more feedback
- participants' discussion can highlight assumptions, etc.
- may need to deal with confounding personalities
- "presentation of self" issues

Strengths of Interview Methods

- No knowledge is needed before starting
- Provides **rich, nuanced data** about the participants' lived experience
- **Reveals internal, invisible aspects** of the participants' experience:

Motivation, affect, identity, priorities, preferences, mental models can reflect on rare past experiences

Weaknesses of Interview Methods

- **Recall** may be biased
- **Reflection/reporting** may be biased
- Requires a lot of time and effort, so generally **small numbers** of users

Surveys

Surveys

What is survey/questionnaires?

Survey (questionnaires) is a list of questions aimed at extracting specific data from a particular group of people.

• Survey can be powerful user research tools if they are designed appropriately

How to design a survey?

- Decide the topic of the survey
- Define the population and sample for your survey
- Create survey questions
- Evaluate and modify survey questions based on six principles
- Send out survey requests
- Analyse survey responses

Decide the topic of the survey

- How well you define your main goal of the survey will determine the population, sample and questions asked, and shape the quality (and possibly usefulness) of the responses.

- At the beginning the survey, provide a concise description of the survey goal to your responders.

Define the population and sample

- Based on the topic of your survey, define the requirements of the population
- Children?
- Smart phone users?
- Heavy users of social media sites?
- Take a representative random sample
- Determine the size of the sample (power analysis)

Create survey questions

- Tools making it easy to design online surveys
- Survey Monkey

  https://www.surveymonkey.com/
- Survey Gizmo

  https://www.surveygizmo.com/

Six principles of designing online surveys

- The survey should clearly instruct respondents about how to proceed
- Make your first item one that is interesting, easily answered, and fully visible
- Restrain the use of color so that consistency and readability are maintained
- Present each question in a format similar to that normally used on paper
- Avoid differences in the appearance of questions that would differ across platforms
- Provide specific instructions on how to take each necessary action

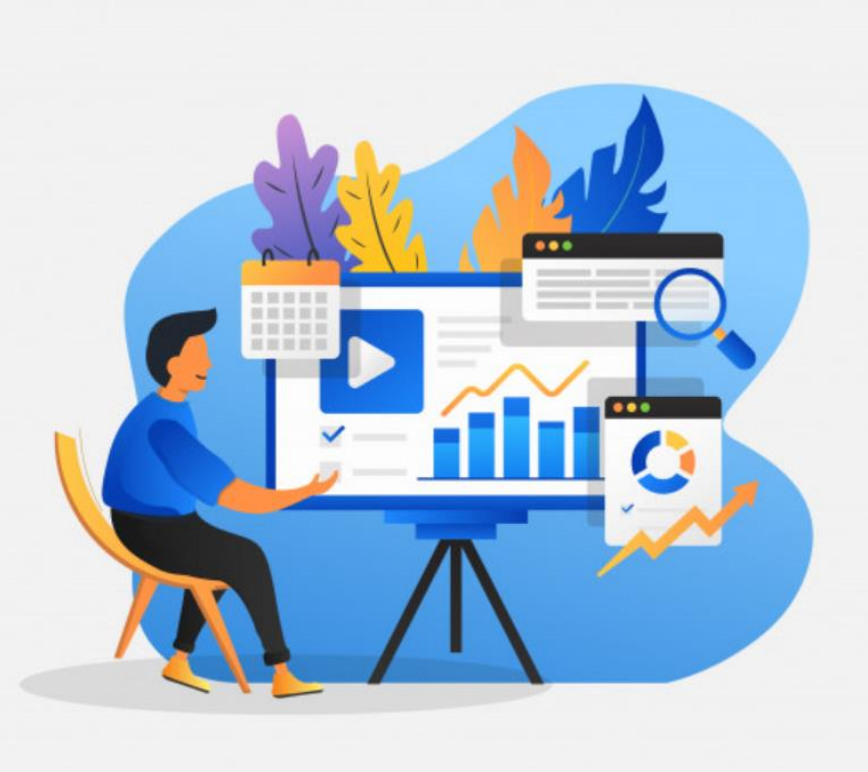

Send out survey requests

- Email
- Embed in web page
- Share survey invitations on social media sites

Analyse survey responses

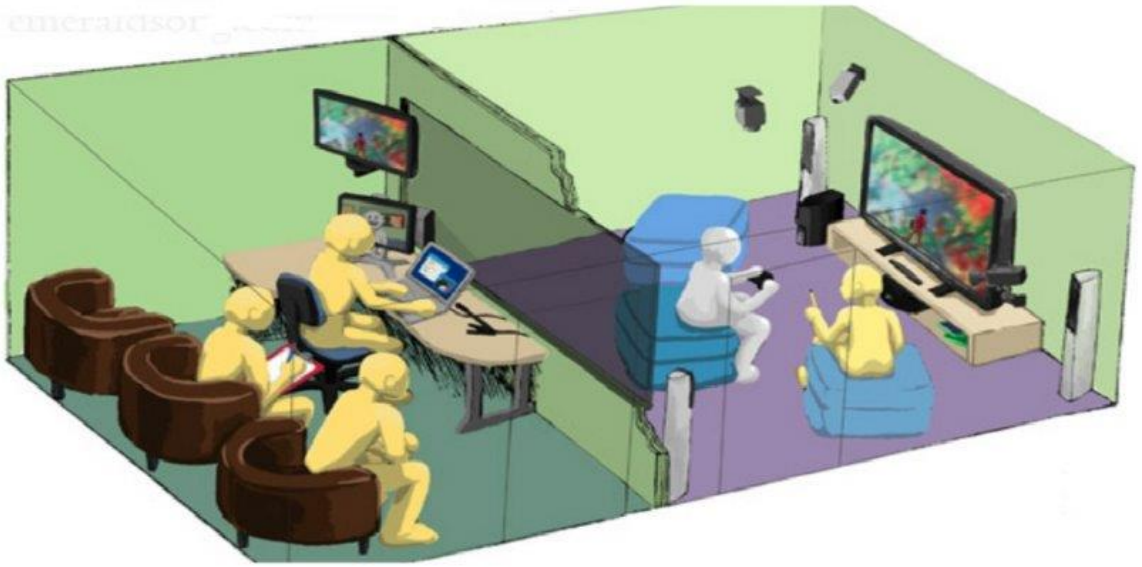

- By analyzing the responses, you can
  - Test your hypotheses
  - Answer your questions

User Research Methods - II

Usability-Lab Studies

- Participants are brought into a **lab**, one-on-one with a researcher, and given a set of scenarios that lead to tasks and usage of specific interest within a product or service

creado por Víctor M. González - victor.gonzalez@acm.org - licencia Creative Commons Attribution-NonCommercial

Ethnographic Field Studies

- Researchers meet with and study participants in **their natural environment**, where they would most likely encounter the product or service in question. See → Contextual Inquiries

http://www.gillianhayes.com/Inf231F12/r3-ethnography-and-contextual-inquiry/

Participatory Design:

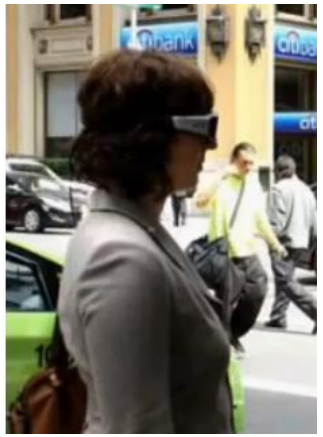

- **Participants are given design elements or creative materials** in order to construct their ideal experience in a concrete way that expresses what matters to them most and why.

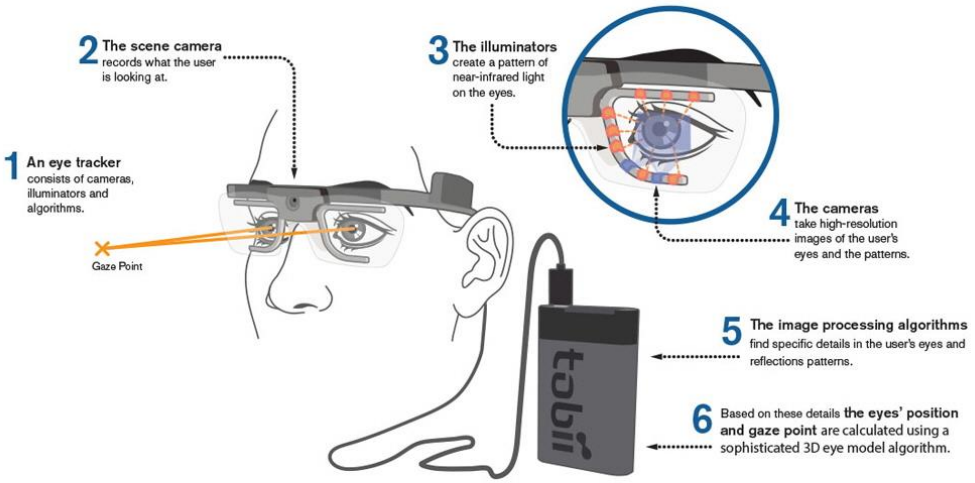

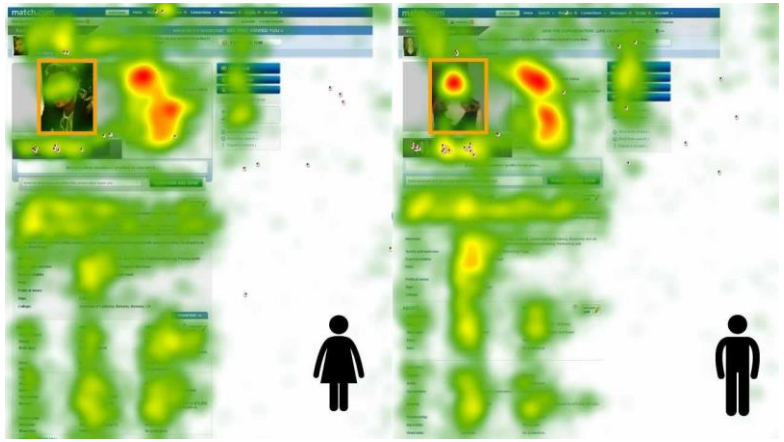

Eye tracking:

- An eye -tracking device is configured to precisely **measure where participants look as they perform tasks or interact naturally** with websites, applications, physical products, or environments.

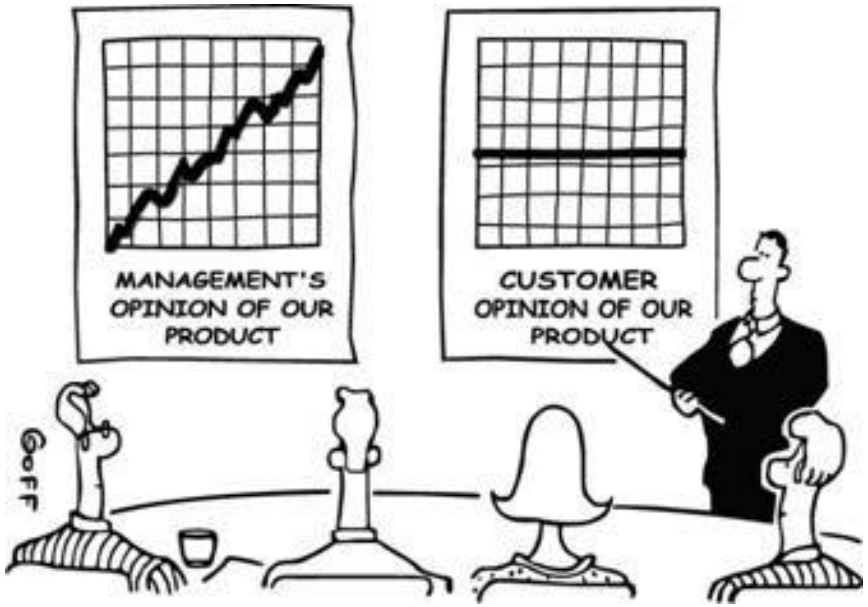

Tobii

- Homework – what is Tobii?

Usability Benchmarking:

- **Tightly scripted usability studies** are performed with several participants, using precise and predetermined measures of performance.

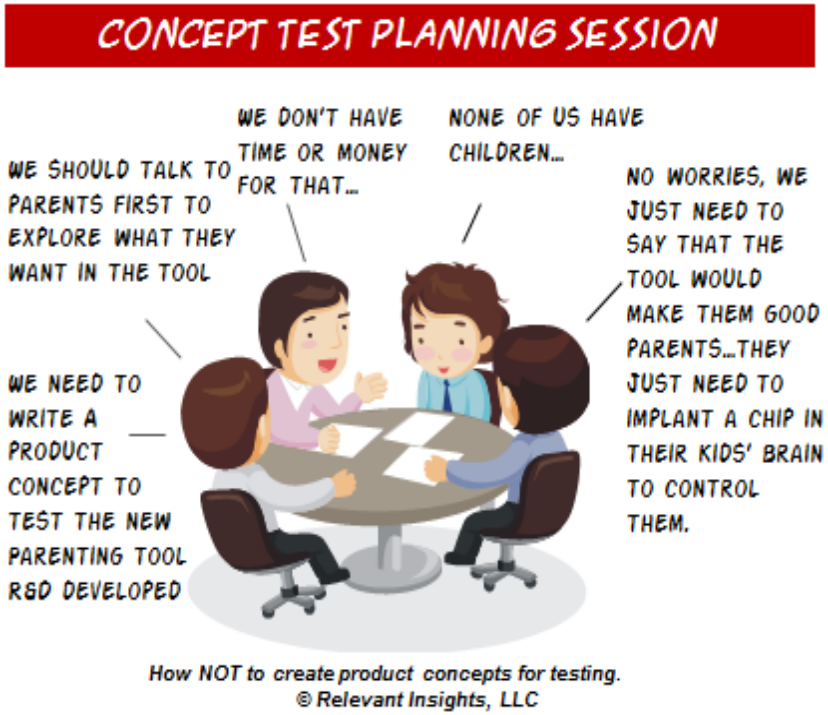

User Research Methods - III

Concept Testing (HW):

- A researcher **shares an approximation of a product or service** that captures the key essence (the value proposition) of a new concept or product in order to determine if it meets the needs of the target audience; it can be done one-on-one or with larger numbers of participants, and either in person or online.
- https://www.akendi.com/blog/concept-testing-that-thinks-its-usability-testing/

How NOT to create product concepts for testing.
© Relevant Insights, LLC

Diary/Camera Studies:

- **Participants are given a mechanism (diary or camera) to record and describe** aspects of their lives that are relevant to a product or service, or simply core to the target audience; diary studies can only be done for data that is easily recorded by participants.

Customer Feedback:

- **<u>Open-ended and/or close-ended information provided by a self-selected sample of users</u>**, often through a feedback link, button, form, or email.

Desirability Studies:

- **Participants are offered different visual-design alternatives and are expected to associate each alternative** with a set of attributes selected from a closed list; these studies can be both qualitative and quantitative.

Three Different Visual Designs

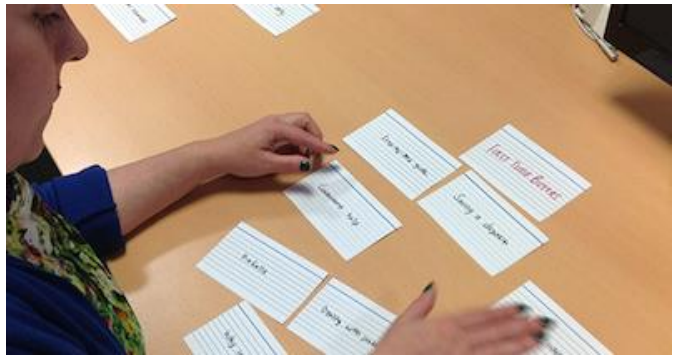

Card Sorting (HW)

- A quantitative or qualitative method that asks users to organize items into groups and assign categories to each group.
- This method helps create or refine the information architecture of a site by **exposing users' mental models.**

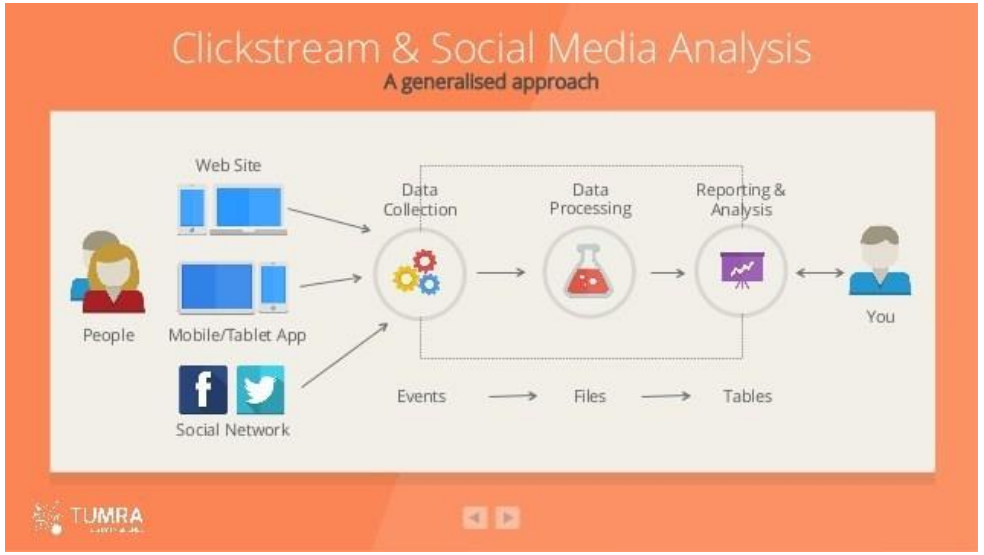

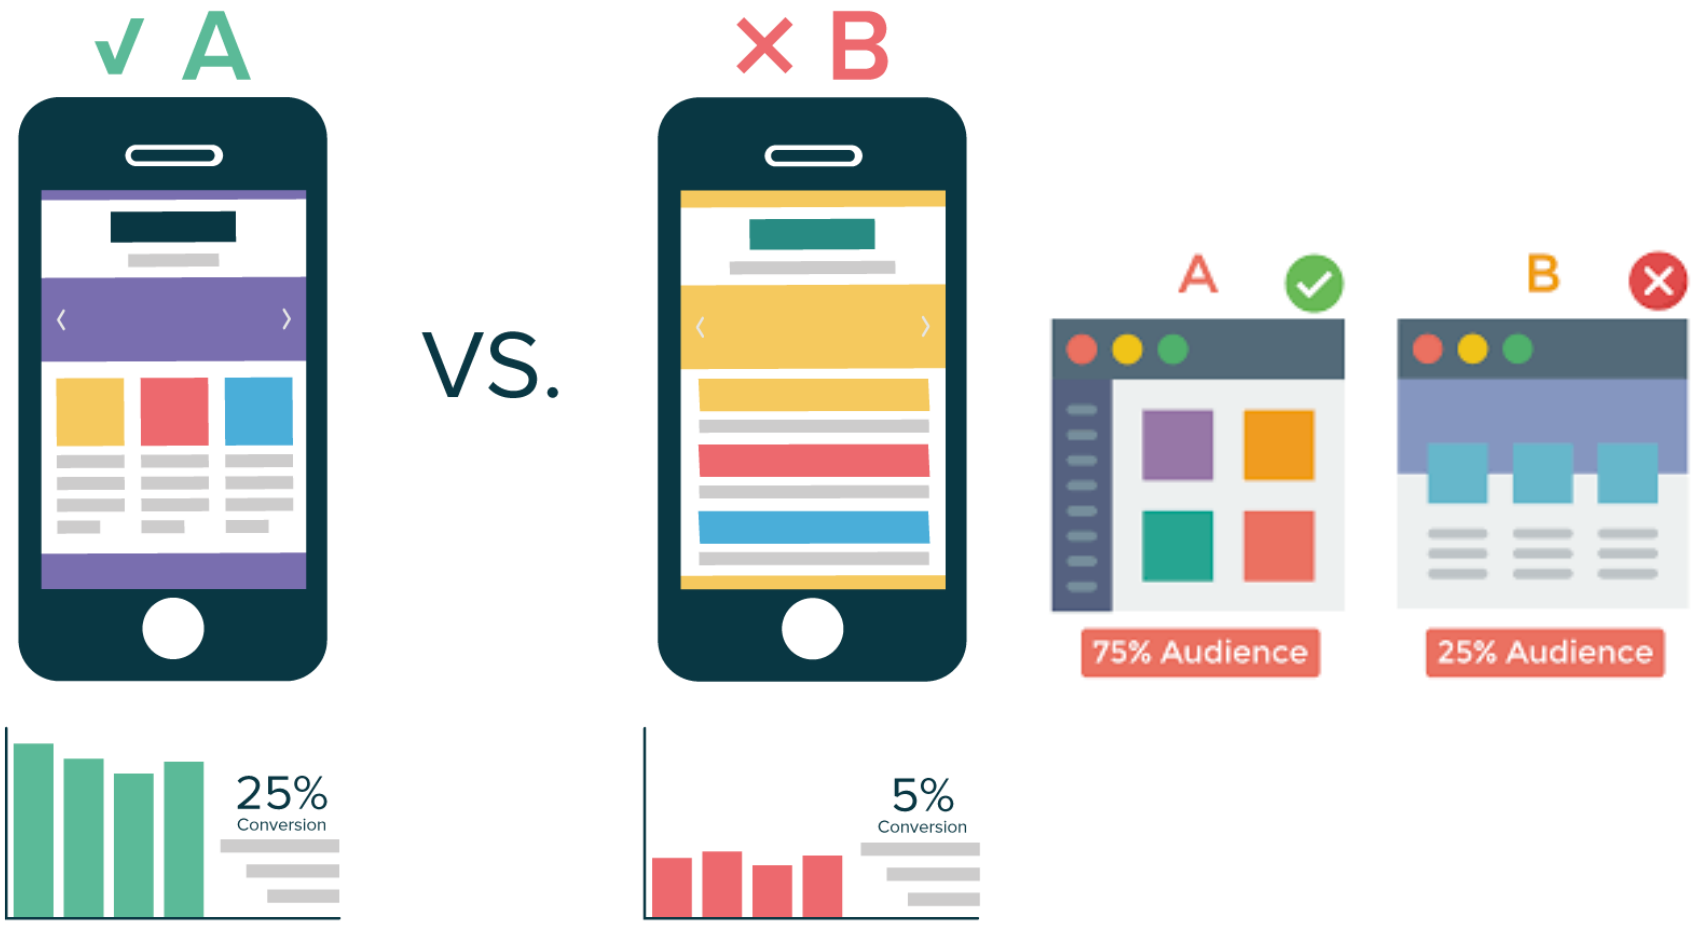

Click-Stream Analysis:

- **Analyzing the record of screens or pages that users clicks on and sees**, as they use a site or software product; it requires the site to be instrumented properly or the application to have telemetry data collection enabled

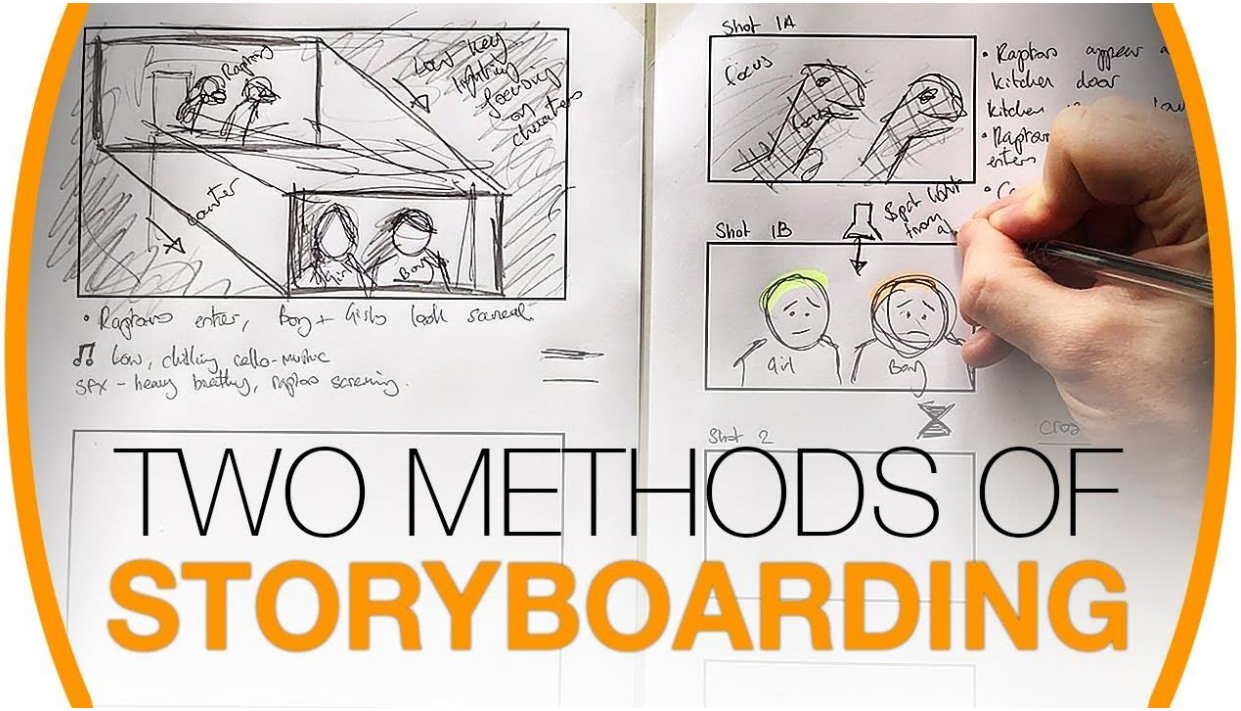

A/B Testing

- Also known as “multivariate testing,” “live testing,” or “bucket testing”: **a method of scientifically testing different designs** on a site by randomly assigning groups of users to interact with each of the different designs and measuring the effect of these assignments on user behavior.

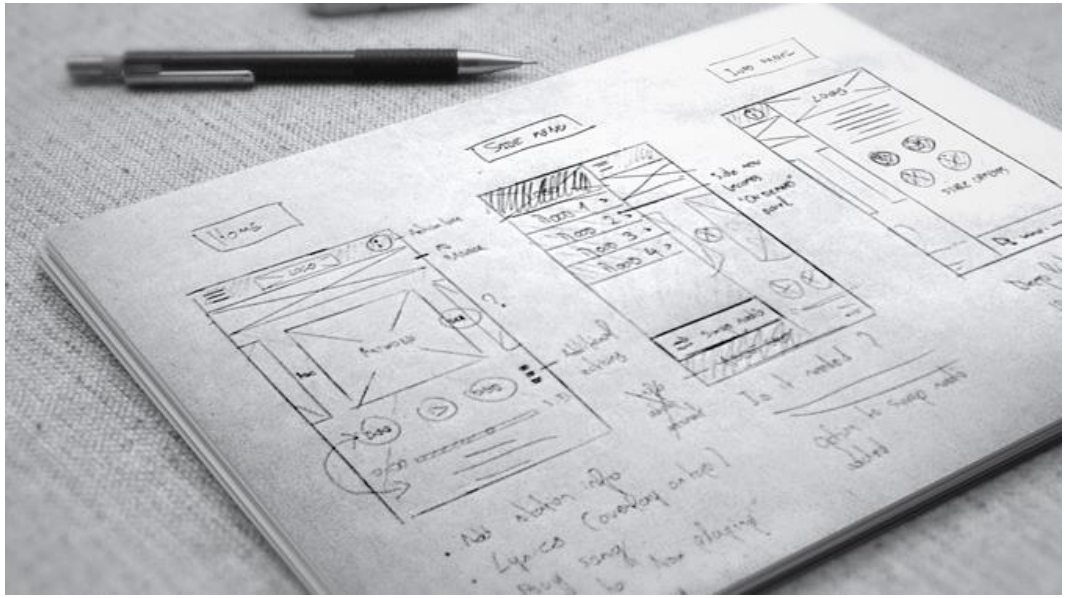

Story Boards

Need Finding Techniques

What is a Storyboard?

- Storyboards are illustrations that represent shots that ultimately represent a story.
- Basically, it's a sequential art, where images are arrayed together to visualize the story.
- This method came from the motion picture production

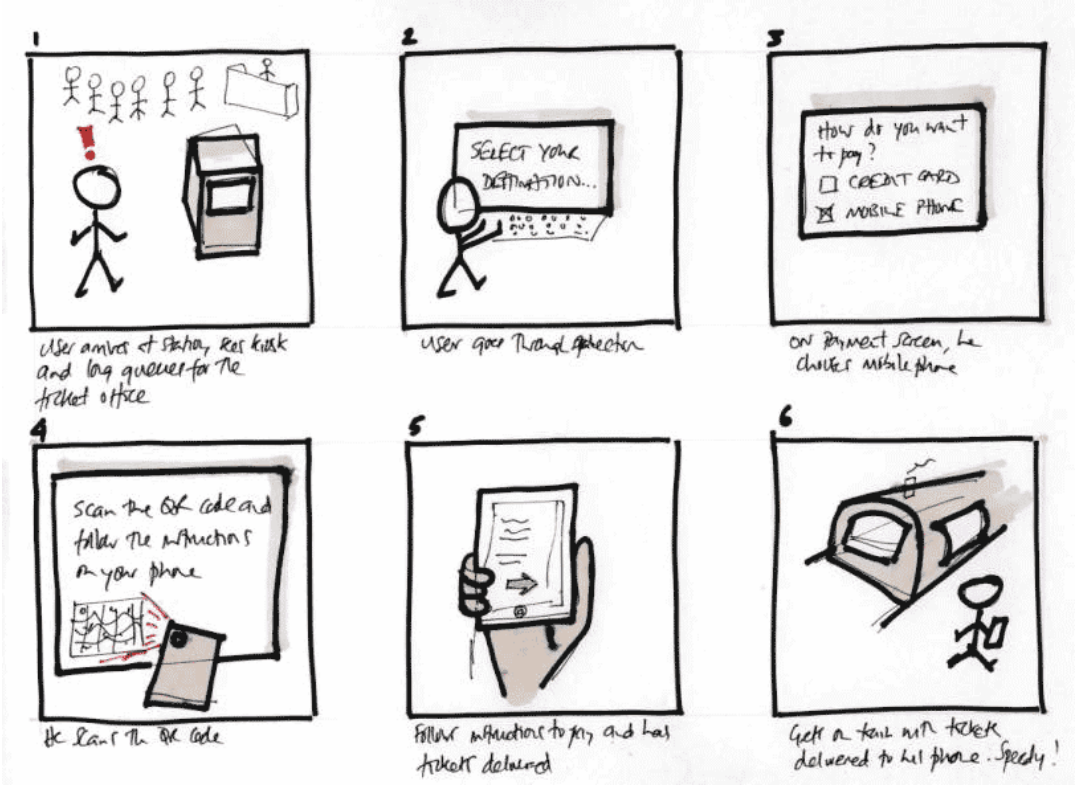

Why does storytelling matter in design?

- Stories are an effective and inexpensive way to capture, relate, and explore experiences in the design process.
- In relation to design process this technique has following benefits:
  - *Human-centered design approach.*
  - *'Pitch and critique' technique (Homework)*
  - *Iterative approach.*

How to work out a story structure?

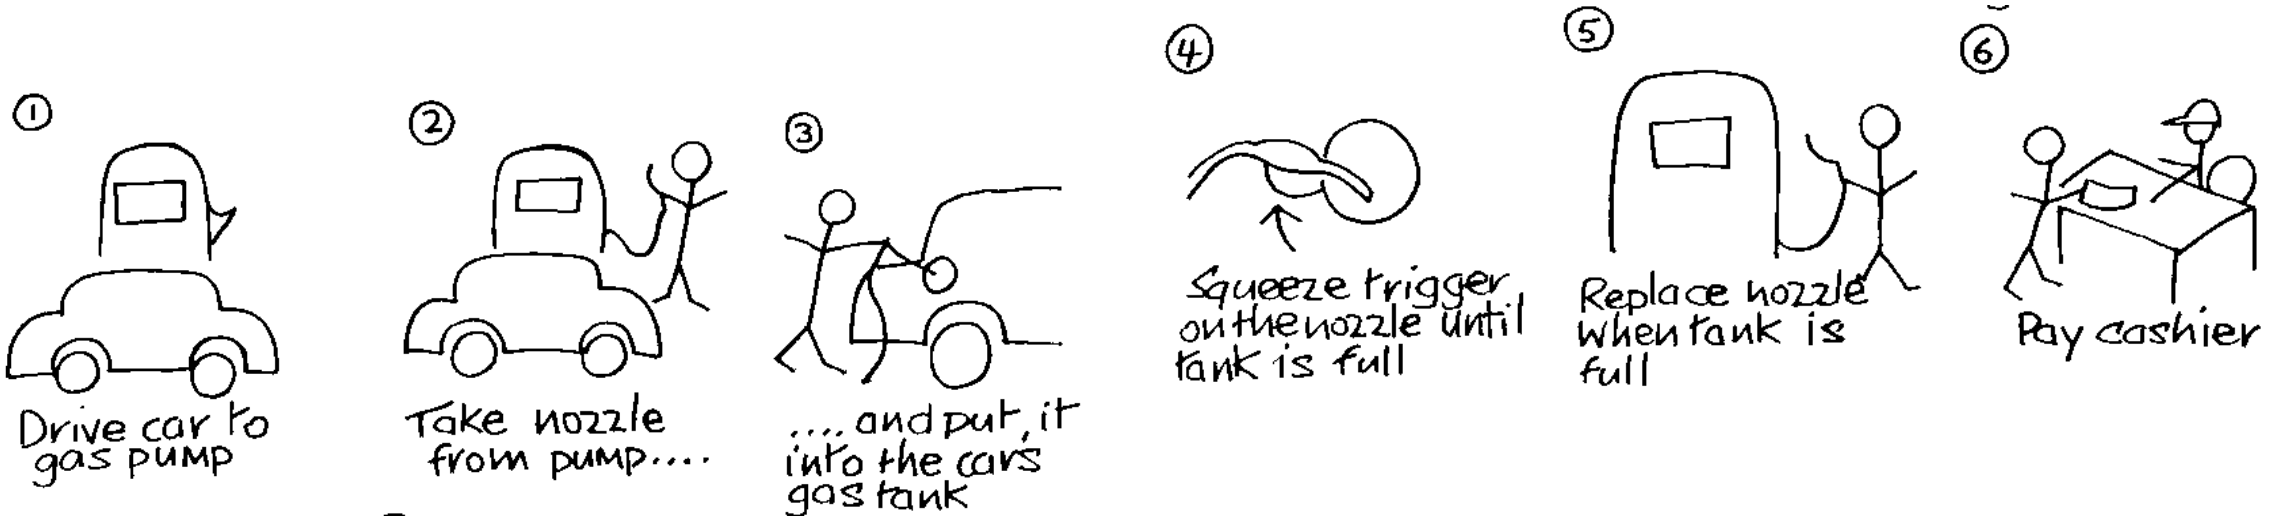

- Each story should have following essential elements:
  - *Character.*
  - *Scene*.
  - *Plot.*

Activity

- Draw set of illustrations (Storyboards) to show

  "How to fuel a car"

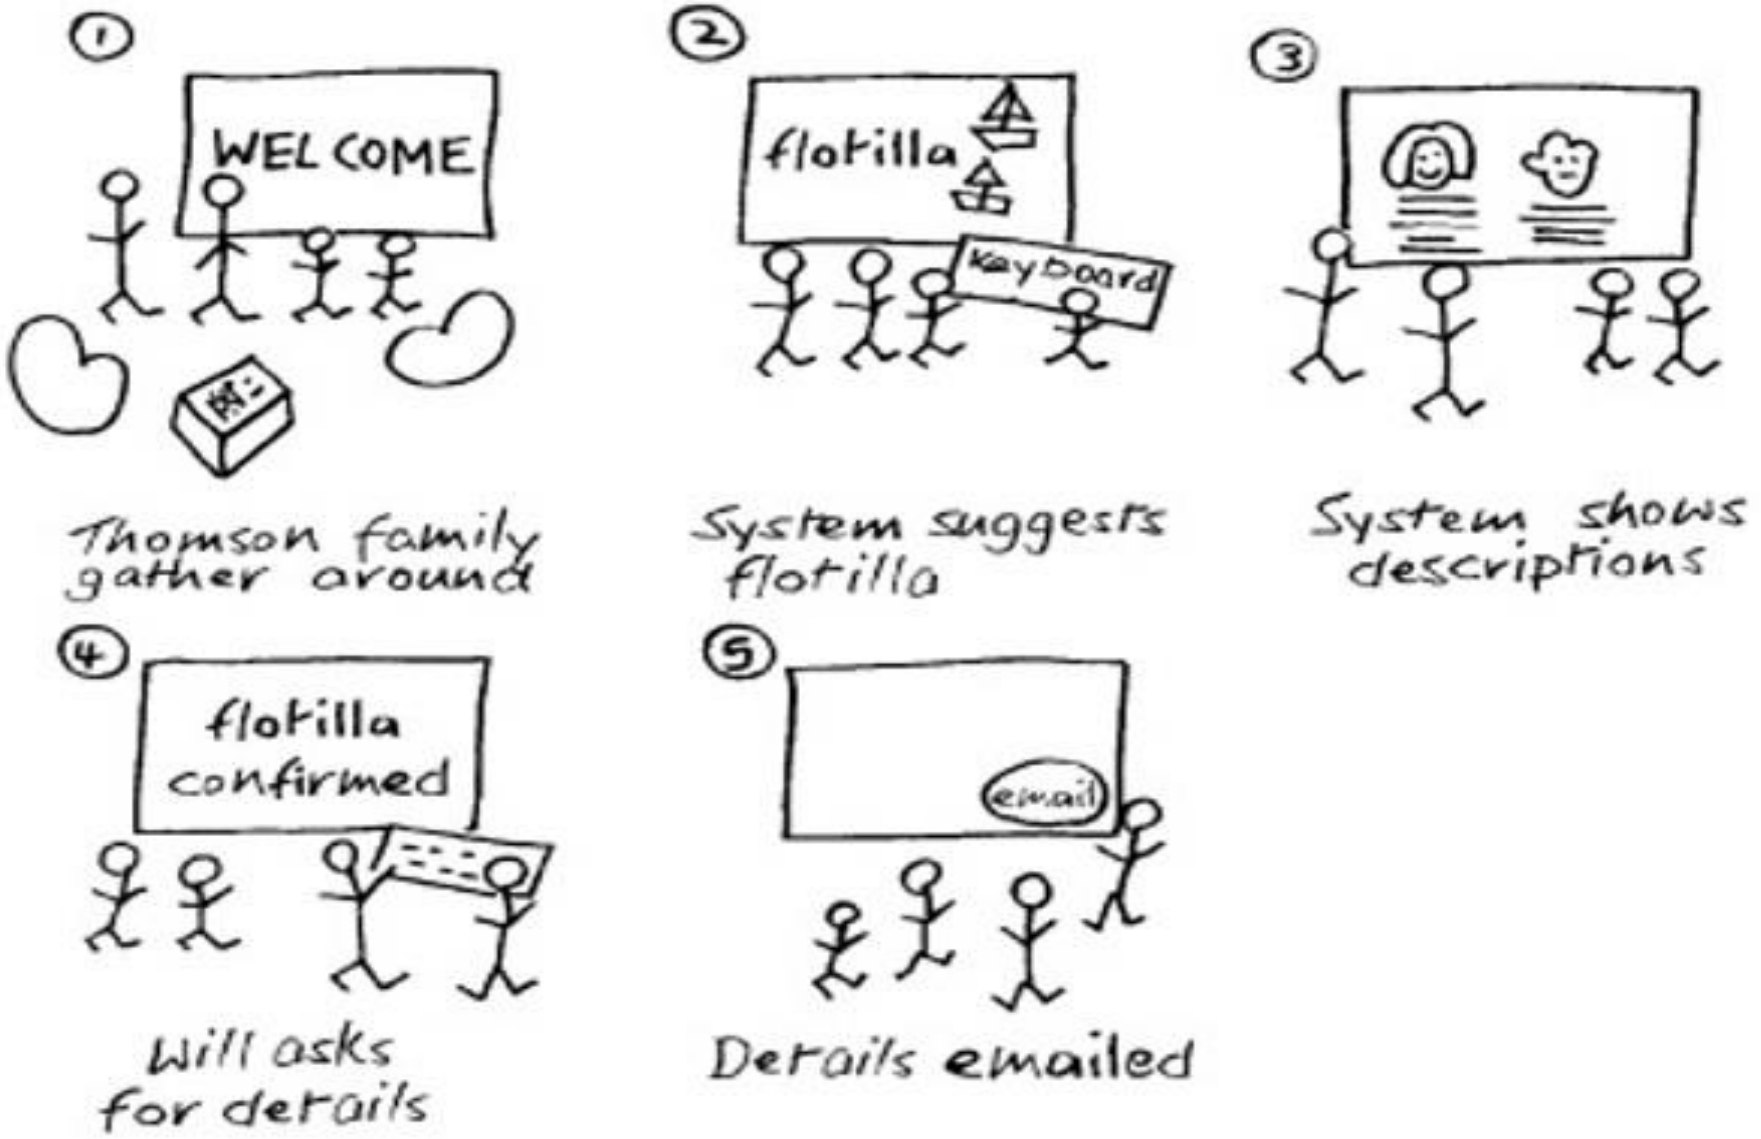

Storyboard

- A storyboard represents a sequence of actions or events that the user and the product go through to achieve a task
- Storyboards are visual organizers,
  - a series of illustrations displayed in sequence for the purpose of pre-visualizing a video, web-based training, or interactive media sequence.
  - they are also used to pre-visualize a web site or application, although typically in that case wireframes are used as part of an iterative design process.

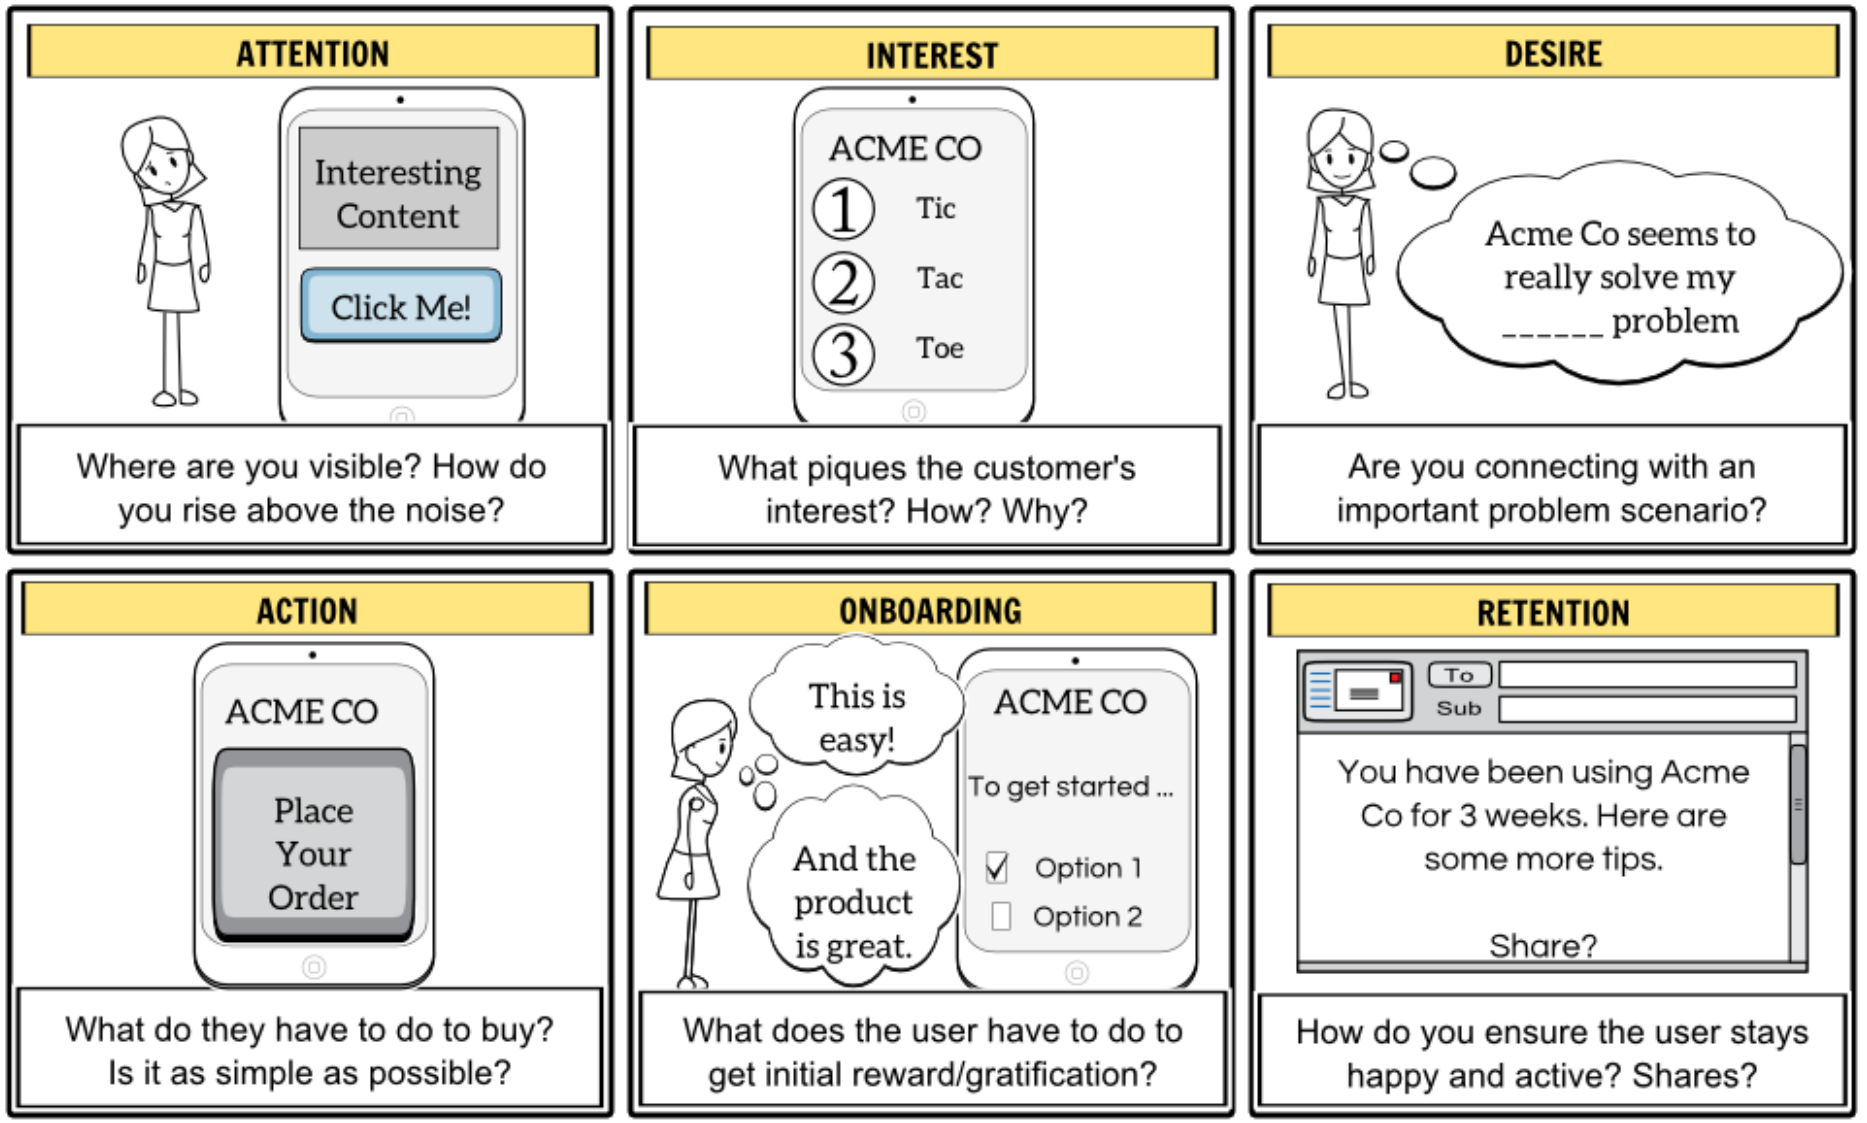

Storyboarding

Why Do You Need a Storyboard?

- It helps you organize your thoughts.
- It helps you plan your video/system more effectively.
- It helps you communicate your ideas to other people.
- It simplifies everything that comes later.

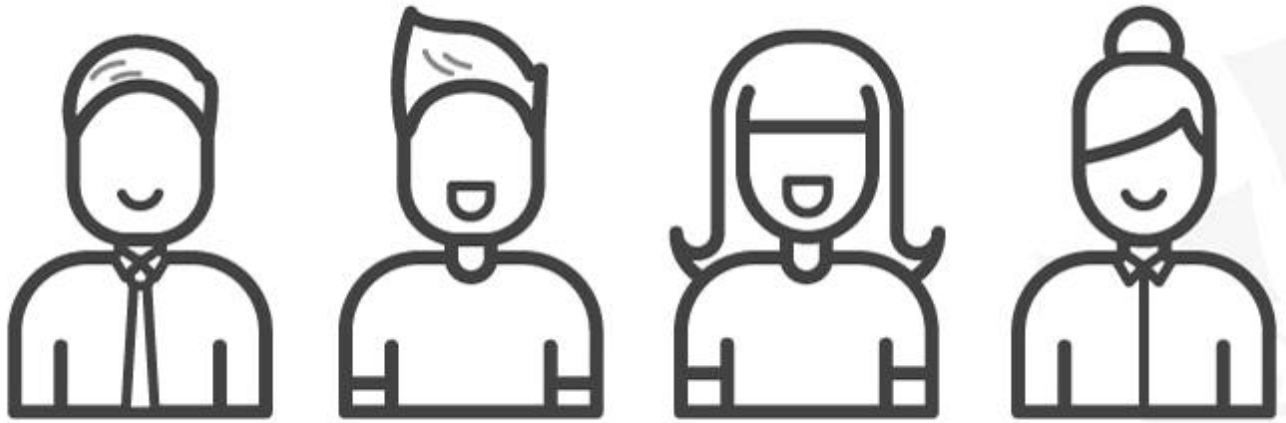

Interpret this storyboard

Interpret this storyboard

Personas

Need Finding Techniques

Personas

A persona is not an actual user, but a pretend user or a “hypothetical archetype” (Cooper, 2004).

A persona represents a specific person in a specific work role and sub-role, with specific user class characteristics. Built up from contextual data, a persona is a story and description of a specific individual who has a name, a life, and a personality.

Personas

Personas are fictional characters, which you create based upon your research in order to represent the different user types that might use your service, product, site, or brand in a similar way.

- Persona is simply a representation of your most common target audience.
- Based on the user centered design approaches
- Based on interviews ,observation and research.

Personas

- Hence, personas do not describe real people, but you compose your personas based on real data collected from multiple individuals.
- Personas are also known as model characters or composite characters.

Effective personas:

- Represent a major user group for your website/product
- Express and focus on the major needs and expectations of the most important user groups
- Give a clear picture of the user's expectations and how they're likely to use the site
- Aid in uncovering universal features and functionality
- Describe real people with backgrounds, goals, and values

How Do We Make Them?

- Step 1. Take a closer look to your data.
- Step 2. Identify patterns
- Step 3. Create persona
  - Photo
  - Name
  - Description
  - Users
  - Problems
- Step 4. Share it!

Creation of a good Persona is not simple, its characteristics are

- Sufficiently reflect the data and conclusions of investigations
- Show the current state of the interviewees instead of their expectation of the future
- Be more realistic than idealistic
- Propose a challenge to the group (but it is not impossible)
- Help the group understand the users better

User Persona

- A representation of a customer type. It can reflect your customer type and their preferences.
- There are 4 different perspectives of personas:
  - **Goal-directed** –focuses on what the user wants
  - **Role-based** –focuses on behavior of the user
  - **Engaging persona** –revolves the understanding of fictitious people and their interaction with a product
  - **Fictional persona** –comes from the user experience design team based on past interactions with users
- To create a user persona,
  - you must be able to gather user data, create scenarios for problems and analysis of the product usability.

Andrew Cole

PRACTICE OWNER

GENDER Male

AGE 54 year old

STATUS Married, 2 children

EDUCATION Bachelor of Medicine (Honours), Doctor of Surgery,

LOCATION Sydney metro

OCCUPATION Senior surgeon, lecture, article contributor

NEEDS:

More support in running a business

PAIN POINTS:

Time-poor

Fast technology changes

READING HABIT

Mostly read print journals & newspapers, only briefly on digital format

TECHNOLOGY

Medium level tech-savvy

GOALS

Write & read quality and interesting articles

Running a succesfull medical practice

Drew

Influencer

ABOUT

- Age 25-34
- $50K-75K
- High Tech Proficiency

EVENT ATTENDANCE ATTRIBUTES

Frequent event go-ers (monthly), tend to be very early planners, and more likely to travel regionally or nationally for an event, tend to go to trending events only.

EVENT INFLUENCERS

- Friends
- Cultural
- Adventure
- Learning
- Networking
- Hype
- Credibility

MOTIVATIONS

Motivated to find new things to do and share them with network, having influence, being the first to know about something and getting tickets right away.

CORE NEEDS

Finding events on social media and being able to easily share them. Being able to see trending events that will up their klout. Also getting notificatinos of on-sale so they can be the first to get tickets.

PAIN POINTS

Finding the time to attend events and staying on budget.

39%
Total Universe GTV

12
Events per month

CAPLIN

Ginnie

BACKGROUND

- 15, Female
- Ongoing Private Education
- Ambitious
- Comfortable using technology to communicate

MOTIVATIONS

- Keeping in touch with her network
- Fashion/street cred
- Keeping up with peers.

FRUSTRATIONS

- Sad people trying to be 'friends' on Facebook
- Having to be in bed @ 11pm
- Being swamped in friends updates
- Missing important status updates

Receives private tutoring in Maths and English as these are not her strong subjects. Enjoys playing for the school's 2nd teams for netball and Lacrosse and is good at art.

She loves recording her favourite shows: ER and Sun Valley High on Sky+ and spends some of her time on her Laptop that Daddy bought her watching videos on YouTube, downloading music, keeping up to date with her friends on Facebook and chatting via MS IM to her cousin who is at University in Leeds.

She loves Ugg boots and Abercrombie & Fitch and uses the Internet to shop and find the cheapest prices.

"I want to easily hook up with my friends whilst watching TV"

Denise Smith

Name: Denise Smith
Occupation: Primary care physician
Age: 41 years old

"**Portability** and turnaround time are my biggest challenges."

Denise is a primary care physician at a group practice and a part time doctor with Plush Care.

For her PlushCare consultations she accesses patient medical records from Practice Fusion (EMR) as well as orders labs and prescriptions, and enters her SOAP notes.

She wonders if there is a way to streamline and simplify the process in order to save time and increase productivity. She also feels that being confined to her desktop or laptop for consultations decreases her flexibility and mobility.

Motivations

- Increase efficiency and flexibility.
- Spend more time caring for patients.
- Earn additional income as a result.

Goals

- Have all patient information on a single platform.
- Access PlushCare at any time and location.

Pain points

- Being restricted to her desktop computer.
- Having to switch between two platforms.
- having to go through an intermediary to communicate with patients for follow ups.

Constraints

- Work Schedule.
- Mobile device while she is away from home or office.

Patient Persona

Joan Stevenson

- 35-years-old
- Middle school teacher
- Married with two kids
- Migraine headaches
- High Blood Pressure
- Lives in Anytown, USA

ABOUT JOAN

Joan is a middle school teacher. She has two young children and lives in the suburbs with her partner/husband. She sets up the family's medical appointments and takes care of her elderly dad, who is in a local retirement home.

DAY-TO-DAY

- Getting her kids to daycare
- Teaching, grading
- Preparing meals for the family
- Getting the kids to bed
- Laundry, cleaning
- Caring for her dad on weekends

SOURCES OF INFORMATION

- Local news
- Facebook, Instagram
- Online articles, blogs
- Other teachers, friends, family

CHALLENGES

- Weight management
- Handling stress
- Budgeting time for self-care

GOALS

- Establish a set exercise schedule
- Develop better nutrition habits

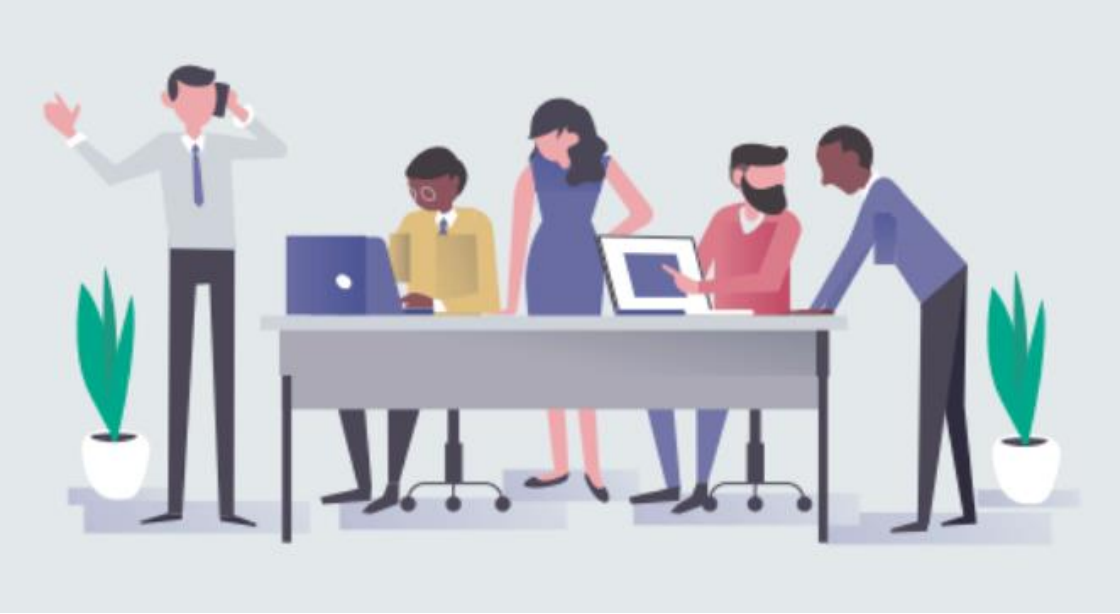

WHAT JOAN WANTS FROM A HEALTHCARE PROVIDER

- **Convenience** — easy ways to schedule her and her family's appointments
- **Affordability** — she's on a teacher's salary and her husband is a contractor. Money is tight and saving for sending the kids to college is hard enough
- **Flexibility** — she's around lots of kids every day, she tends to pick up whatever her class has and brings it home. Making last minute appointments is important.
- **Personalized and authentic care.**
- **Educational resources to learn from for better self care management.**
- **Efficient appointments.**

surveygizmo | enterprise

Contextual Inquiry

Need Finding Techniques

What Is Contextual Inquiry?

Descriptive field research method

- Depends on conversations with users in the context of their work
- Used to define requirements, plans and designs.
  - Discover the real requirements of the work
- Drives the creative process:
  - In original design
  - In considering new features or functionality

Context

- Definition:
- "The interrelated conditions within which something occurs or exists"
- Understand work in its natural environment
  - Go to the user
  - Observe real work
  - Use real examples and artifacts

    "Artifact": An object created by human workmanship
  - Interview while she/he is working
  - More reliable than asking them
- Context exists even when not a "work" activity
  - Use "work" here just to mean "doing something"
  - Can be home, entertainment, etc.

Elements of User's Context: Pay Attention to all of these

- User's work space
- User's work
- User’s workarounds
- User's work intentions
- User's words (language used)
- Tools used
- How people work together
- Business goals
- Organizational and cultural structure

Why Context?

- Design complete work process
  - Fits into “fabric” of entire operations
  - Not just “point solutions” to specific problems

- Integration!
  - Consistency, effectiveness, efficiency, coherent
  - Design from data
  - Not just opinions, negotiation
  - Not just a list of features

Key distinctions about CIs

Interviews, Surveys, Focus Groups	Contextual Inquiry
Summary data & abstractions	Ongoing experience & concrete data
What customers say	What users do
Subjective	Objective
Limited by reliability of human memory	Spontaneous, as it happens
What customers think they want	What users actually need

Who?

Users

- Age
- Representative of different roles
- Note: may not be people who will be doing the purchasing of the system
  - E.g., if for an enterprise; public kiosk

Interviewers: "Cross-functional" team

- Designers
- UI specialists
- Product managers
- Marketing
- Technical people

Partnership

- Definition:
  - A relationship characterized by close cooperation
- Build an equitable relationship with the user
- Suspend your assumptions and beliefs
- Invite the user into the inquiry process

Why is Partnership Important?

- Information is obtained through a dialog
- The user is the expert.
- Not a conventional interview or consultant relationship
- Alternative way to view the relationship:
- Master/Apprentice
  - The user is the “master craftsman” at his/her work
  - You are the apprentice trying to learn

Establishing Partnership

- Share control
- Use open-ended questions that invite users to talk:
  - "What are you doing?"
  - "Is that what you expect?"
  - "Why are you doing...?"
- Let the user lead the conversation
- Listen!
- Pay attention to communication that is non-verbal

Interview Recording and Note-Taking

- Do record interview
  - Video recordings
  - Screen capture software with laptop microphone for user

- When to take notes?
  - Note taking can help you pay closer attention
  - Notes lead to faster turn-around
  - Do not let it interfere with interviewing
    - Usually would use a second person

- How to record?
  - What the user says – in quotes
  - What the user does – plain text
  - Your interpretation – in parentheses
  - Write fast!

Analysis

- In the moment:
  - Simultaneous data collection and analysis during interview
- Post interview:
  - Using notes, tapes, and transcripts
- Analysis by a group:
  - Integrates multiple perspectives
  - Creates shared vision
  - Creates shared focus
  - Builds teams
  - Saves time

Defining the Tasks

- In a real Contextual Inquiry, user decides the tasks
  - Investigate real-world tasks, needs, context
- But you still must decide the focus
  - What tasks you want to observe
  - That are relevant to your product plan
- But for lab assignment , you will have to invent some tasks.

Test Tasks

- Task design is difficult part of usability testing
- Representative of “real” tasks
  - Sufficiently realistic and compelling so users are motivated to finish
  - Can let users create their own tasks if relevant
- Appropriate difficulty and coverage
  - Should last about 2 min. for expert, less than 30 min. for novice
  - Short enough to be finished, but not trivial
- Tasks not humorous, frivolous, or offensive
- Easy task first, progressively harder
  - But better if independent

Initial Questions for the Users

- Find out the context through initial questions
  - When would you normally do this kind of task?
  - Who would be involved in making the decisions?
  - What would influence any decisions?
  - How would you know what to do?
    - What information would you use to help decide?
- Getting their feelings about the tasks and the context

Test Script

- Useful to have a script
  - Make sure say everything you want
  - Make sure all users get same instructions
- Should read instructions out loud
  - Ask if users have any questions
- Make sure instructions provide goals only in a general way, and doesn't give away information
  - Describe the result and not the steps
  - Avoid product names and technical terms that appear on the web site/application
    - Don't give away the vocabulary
- Example:

  "The clock should have the right time";

  Not: "Use the hours and minutes buttons to set the time"

Scenarios

Need Finding Techniques

“Jeremy, 52, a senior manager for a medical supplies company, needs constantly updated information on purchasing-related issues while he travels between work and hospital sites so he can use/allocate resources optimally. He’s highly skilled, organized and diligent. However, with recent layoffs he now struggles to manage his workload and is too drained to enjoy his career. He strains to handle tasks which his former assistant previously performed, stay current with issues and investigate supply-chain problems, while he tries to find alternatives that would be more economical in the financial climate.

He wants something convenient like an app to take him straight to only the *most relevant* updates and industry news, including current information feeds about share prices, tariffs on foreign suppliers, budget decisions in local hospitals and innovations in the medical devices he handles (mostly lung and cardiovascular products). Instead of continuing to liaise with three other managers and spending an hour generating one end-of-day report through the company intranet, he’d love to have all the information he needs securely on his smartphone and be able to easily send real-time screenshots for junior staff to action and file and corporate heads to examine and advise him about.”

https://www.interaction-design.org/literature/topics/user-scenarios#_msocom_5

What are User Scenarios?

- A user scenario is the fictitious story of a user's accomplishing an action or goal via a product.
- Scenarios describe the stories and context behind why a specific user or user group comes to your site.
- They note the goals and questions to be achieved and sometimes define the possibilities of how the user(s) can achieve them on the site.
- Scenarios are critical both for designing an interface and for usability testing.
- Scenarios are usable in **design** and the **Usability Testing**

What to Consider When Writing Scenarios

Good scenarios are concise but answer the following key questions:

- **Who is the user?** Use the personas that have been developed to reflect the real, major user groups coming to your site.
- **Why does the user come to the (site)?** Note what motivates the user to come to the site and their expectations upon arrival, if any.
- **What goals does he/she have**? Through task analysis, you can better understand the what the user wants on your site and therefore what the site must have for them to leave satisfied.
- **How can the user achieve their goals on the site?** Define how the user can achieve his/ her goal on the site, identifying the various possibilities and any potential barriers

Using a Scenario

1. As a basis for the overall design.
2. For technical implementation.
3. As a means of cooperation within design teams.
4. As a means of cooperation across professional boundaries,

~ (Bødker, 2000, p. 63): ~

Using a Scenario

- specifically, scenarios have been used as scripts for user evaluation of prototypes, as the basis of storyboard creation.
- to build a shared understanding among team members.
- Scenarios are good at selling ideas to users, managers, and potential customers.

Summary

Need finding and user research techniques

- Understand the user
- Personas & Storyboarding
- Contextual Inquiry
- Scenarios
